COMMISSION

COMMISSION DECISION

of 8 May 1996

establishing an inventory and a common nomenclature of ingredients employed in cosmetic products

(Text with EEA relevance)

(96/335/EC)

THE COMMISSION OF THE EUROPEAN COMMUNITIES,

having regard to the Treaty establishing the European Community,

Having regard to Council Directive 76/768/EEC of 27 July 1976 on the approximation of the laws of the Member States relating to cosmetic products⁽¹⁾, as amended by Commission Directive 95/34/EC⁽²⁾, and in particular Article 5a and Article 7(2) thereof,

After consultation of the Scientific Committee on Cosmetology,

Whereas the inventory of ingredients used in cosmetic products must include a section on perfume and aromatic raw materials and a section on other substances;

Whereas this inventory must contain information on the identity of each ingredient, notably the chemical, INCI (ex-CTFA), Ph. Eur., INN and Iupac names, the EINECS/Elincs, CAS and Colour Index numbers, the common name referred to in Article 7(2) of Directive 76/768/EEC, as well as the ingredient's functions and, where appropriate, any restrictions and conditions of use and warnings which must be printed on the label;

Whereas, in addition to providing necessary information on the ingredients used in cosmetic products, the inventory must be seen in the context of the obligation laid down by Article 6 (1) of Directive 76/768/EEC, which stipulates indication on the product and/or packaging of the function of the product and the list of ingredients as of 1 January 1997 in the case of cosmetic products placed on the market;

Whereas the proposed inventory must be sufficiently complete to allow the labelling of ingredients for cosmetic products;

Whereas it shall, however, be indicative and shall not constitute a list of substances authorized for use in cosmetic products;

Whereas it must be periodically updated;

Whereas a common ingredients nomenclature will make it possible to identify the substances by using a single name in all the Member States, with the result that consumers will easily be able to recognize substances which they have been advised to avoid (for example because of allergies), no matter where they buy cosmetic products in the Community;

Whereas the INCI (International Nomenclature Cosmetic Ingredient) names best meet these requirements, being relatively simple and, moreover, already in use at international level;

Whereas the measures provided for in this Decision are in accordance with the opinion of the Committee on the Adaptation to Technical Progress of the Directives on the Removal of Technical Barriers to Trade in the Cosmetic Products Sector;

⁽¹⁾ OJ No L 262, 27. 9. 1976, p. 169.

⁽²⁾ OJ No L 167, 18. 7. 1995, p. 19.

DECIDES:

Article 1

The inventory of ingredients used in cosmetic products provided for in Article 5a of Directive 76/768/EEC and reproduced in the Annex is adopted.

Article 2

The INCI (International Nomenclature Cosmetic Ingredient) names contained in the inventory shall constitute the common nomenclature for the purposes of Article 7 (2) of Directive 76/768/EEC.

ANNEX

INVENTORY OF COSMETIC INGREDIENTS

GENERAL INTRODUCTION

1. Council Directive 93/35/EEC of 14 June 1993 amending for the sixth time Directive 76/768/EEC on the approximation of the laws of the Member States relating to cosmetic products⁽¹⁾ (hereafter called 'cosmetic products Directive') provides that the Commission shall, under the procedure involving the Committee on Adaptation to Technical Progress referred to in Article 10 of Directive 76/768/EEC, compile an inventory of ingredients employed in cosmetic products, on the basis in particular of information supplied by the industry concerned. The inventory shall be indicative and shall not constitute a list of substances authorized for use in cosmetic products.

The inventory must be divided into *two sections* concerning:

- perfume and aromatic raw materials,
- other substances.

The inventory must contain information concerning the identity of the ingredient, notably: the INCI (ex CFTA), Ph. Eur., INN, Iupac and chemical names, the EINECS/ELINCS, CAS and Colour Index numbers, the common name referred to in Article 7 (2) of the amended Directive 76/768/EEC, as well as the ingredient's functions and any mandatory restrictions, conditions of use and warnings.

In addition to the relevance of having information on the ingredients used in cosmetic products, whose safety has to be guaranteed, the inventory must be seen in the context of the obligation laid down by the new Article 6 (1) (Article 1 (7) of Directive 93/35/EEC) which makes it mandatory to indicate on the product and/or packaging (for the list) *the function of the product and the list of ingredients* as of 1 January 1997 for cosmetic products placed on the market.

Directive 93/35/EEC also provides that Member States may require that the ingredients be indicated in a language easily understood by the consumer and that to this end the *Commission must adopt a common ingredients nomenclature* in accordance with the CATP procedure (Article 1 (10) of Directive 93/35/EEC amending Article 7 (2) of Directive 76/768/EEC).

This common nomenclature will make it possible to identify the substances by using a unique name in all the Member States with the result that consumers will easily be able to recognize substances which they have been advised to avoid (for example because of allergies), no matter where they buy cosmetic products in the European Union.

Pursuant to Commission Decision of ..., all the INCI names constitute the common nomenclature.

2. The inventory proposed by the Commission includes the two sections provided for in Directive 93/35/EEC, namely:
 - a list of cosmetic ingredients other than perfume and aromatic raw materials (Section 1),
 - and
 - a list of perfume and aromatic raw materials (Section 2).

⁽¹⁾ OJ No L 151, 23. 6. 1993, p. 32.

The proposed inventory is the best that could be achieved in the very short time limits imposed by Directive 93/35/EEC. The aim was that it should be sufficiently complete to permit cosmetic products to be labelled and also as correct and detailed as possible.

However, Article 1 (4) (3) of Directive 93/35/EEC specifies that the inventory must be periodically updated.

SECTION I

COSMETIC INGREDIENTS OTHER THAN PERFUME AND AROMATIC RAW MATERIALS

Introduction

This list has been prepared in particular on the basis of information provided by the European Cosmetic Industry represented by the European Cosmetic Toiletry and Perfumery Association (Colipa).

The list covers all items foreseen under Article 5a of the cosmetic products Directive concerning identity, usual function(s), and restrictions on cosmetic ingredients. The ingredients are listed in the alphabetical order of the INCI names, which constitute together the common nomenclature for labelling throughout the EU.

The following fields are included:

1. INCI name

This refers to the common nomenclature for ingredient labelling on the packaging of cosmetic products. The conventions used for the nomenclature are attached.

The abbreviation 'INCI' stands for International nomenclature cosmetic ingredient. It refers to a new terminology developed by Colipa to take into account the need for a truly international approach. It should be noted that Article 5a of the cosmetic products Directive refers to CTFA, which has been replaced by INCI as the correct designation for the nomenclature. An INCI name may cover several chemical entities.

For cosmetic colorants, the colour index (CI) number or the name listed in Annex IV has to be used for ingredient labelling, as indicated in Article 6 (1) (g) of the cosmetic products Directive. The CI number therefore becomes the INCI name for these ingredients.

2. INN name

This abbreviation refers to the International non-proprietary name recommended by the World Health Organization. It is listed where applicable.

3. Ph. Eur. name

This abbreviation refers to the name in the European pharmacopoeia. It is listed where applicable.

4. CAS number

This abbreviation refers to the code number developed by the Chemical Abstracts Service. The CAS number is a worldwide code enabling identification of chemical substances. It is listed when available.

5. EINECS/ELINCS number

This refers to the numerical code provided either under the European inventory of existing commercial chemical substances (EINECS) for existing chemicals or under the European list of notified chemical substances (ELINCS) for new chemicals. It is listed where applicable.

6. Chemical/Iupac name

This field covers the chemical name and the Iupac (International Union of Pure and Applied Chemistry) name. It covers EINECS names, which make use of the Iupac nomenclature, or CAS names, which clearly offer a suitable identification of the ingredient. Both items have been combined to avoid duplication.

7. Restriction

This field refers to ingredients covered under the Annexes of the cosmetic products Directive, in an abbreviated format. (e.g.: 'III/1, 16' means Annex III, Part 1, No 16). The list covers all references to the Annexes up to and including the 17th Commission Directive 94/32/EC adapting the Annexes of the cosmetic products Directive to technical progress.

Regular updates of this field will be essential as the Annexes of the Directive are adapted to technical progress.

8. Function

This field refers to the usual function(s) of the ingredient as used in cosmetic products; an ingredient may have several functions.

The listed functions are defined as follows:

ABRASIVES

Substances which are added to cosmetic products either to remove materials from various body surfaces or to aid mechanical tooth cleaning or to improve gloss.

SECTION II

PERFUME AND AROMATIC RAW MATERIALS

1. Introduction

These lists are representative of the basic materials used in perfumes and aromatic compositions. The lists were compiled mainly on the basis of information provided by EFFA (European Flavour and Fragrance Association). They constitute the inventory of fragrance ingredients.

2. Identity of fragrance ingredients

Fragrance ingredients do not need a common nomenclature because the fragrance or their ingredients (perfume and aromatic compositions and their raw materials) must be indicated on the labels using the words 'perfume' or 'flavour' (Article 6 (1) (g) of the cosmetic products Directive). Hence the information on the identity of these substances consists of a chemical name identifying the substances in the clearest possible way. Such a system already exists in the 'acquis communautaire' — namely the Einecs inventory ('European Inventory of Existing Commercial Chemical Substances'), (*Official Journal of the European Communities* No C 146A of 15 June 1990) and Elincs ('European List of Notified Chemical Substances'), whose most recent version was published in *Official Journal of the European Communities* No C 361 of 17 December 1994. These publications mainly contain the information necessary to describe a chemical substance in an unequivocal manner, *i.e.* a chemical name, a CAS number and an Einecs number.

These lists also include substances of unknown structure, of variable composition or of biological origin (so-called UVCB substances). This is why the inventory of fragrance ingredients was compiled on the basis of the Einecs system. The other identifiers mentioned in Directive 93/35/EEC cannot be applied (CTFA name, European Pharmacopoeia name, names recognized by the World Health Organization, Colour Index number). The Iupac identifier is covered by the Einecs identifier.

When substances have not been included in the Einecs system, only the CAS number and CAS name have been indicated.

3. Function of fragrance ingredients

The function of all ingredients included in this inventory is to perfume. Certain ingredients however may have several functions.

Substances used in fragrances for their properties in mixtures (solvents, excipients, etc.) are also included in the list. According to Article 6 (1) (g) of the cosmetic products Directive, these substances may be considered as part of the fragrance and do not have to be declared as a cosmetic ingredient, provided they are not used in excess of the recommended levels.

4. Restrictions applicable to fragrance ingredients

Restrictions on the use of a given ingredient are identified wherever relevant. These restrictions are set out in the Directive itself or in the IFRA (International Fragrance Association) Code of Practice. These restrictions may take the form of a quantitative limitation (expressed as a percentage of the final product or as a concentration for application to the skin), or the ingredient may have to meet certain specifications or may only be used in conjunction with certain specified ingredients.

These substances are marked in the list with one asterisk (*) (IFRA restrictions) or two asterisks (**) (restrictions in the cosmetic products Directive).

5. The fragrance inventory as a representative list

It should be noted that in this inventory the various qualities of a given ingredient, such as geraniol, have not been recorded separately; the same applies to different qualities of natural products with the same botanical origin. Orange oils from Brazil, Florida, California, etc., concentrated or otherwise, are all indicated under a single entry, *i.e.* 'sweet orange extractives', CAS 8028-48-6, EINECS 232-433-8. This rubric is defined as follows: 'Extractives and their physically modified derivatives such as tinctures, concretes, absolutes, essential oils, oleoresins, terpenes, terpene-free fractions, distillates, residues, etc. obtained from *Citrus sinensis*, Rutaceae'.

Neither does the inventory include ingredients whose chemical identity is secret and constitutes the intellectual property of a fragrances manufacturer. These substances are not sold as such but used exclusively in fragrance compositions, generally at low concentrations to give them a certain characteristic and/or exclusiveness.

NOMENCLATURE CONVENTIONS

The conventions used for establishing INCI names are as follows:

1. In order to facilitate use and clarity, INCI names have been designed to require a minimum of punctuation and capitalization.
2. Wherever new nomenclature has been adopted, every effort has been made to use the shortest name consistent with these rules.
3. Simple chemical names are used wherever possible.
4. Recognized chemical abbreviations are used where applicable. A list of the abbreviations used in the Inventory may be found on page 684.
5. Traditional stems are retained as combining forms when consistent with other systems.
6. Abbreviations are utilized for simplifying the nomenclature of families of complex ingredients when applicable.
7. Compounds that are related or are similar to materials described in recognized sources are named, whenever possible, by analogy to the listed names.
8. Singly substituted derivatives do not usually include the prefix 'mono'. This term is used only when required to prevent ambiguity. The absence of a suitable prefix implies 'mono', *e.g.* Glyceril stearate.
9. The term 'Glyceride' has been utilized to describe a monoglyceride. Mixtures of mono-, di- and triglycerides are referred to as 'Glycerides'. Triglycerides are assigned specific nomenclature, *e.g.* Tristearin.
10. Multiple substitution is routinely described with the appropriate prefix, such as 'di-', 'tri-' or 'tetra-', *e.g.* Glyceryl distearate.
11. Names of ingredients, other than colours, that contain terminal numbers are generally hyphenated. Derivatives of hyphenated materials retain the original hyphen.
12. Hydratation states are not usually expressed.
13. Straight-chain alkyl groups are described by their common stem names.
14. Materials containing mixtures of even-carbon chain length fractions are named by the appropriate, commonly used fatty stem term. Materials containing mixtures of even- and odd-carbon chain length fractions are designated by alternate nomenclature.
15. Branched-chain alkyl groups are usually described by the prefix 'iso' followed by the common stem name for the comparable straight-chain group (*e.g.* Isostearyl alcohol, Isocetyl alcohol). The major exception to this rule is the nomenclature for the Guerbet alcohols. These materials are named chemically (*e.g.* Octyldodecanol, Decyltetradecanol) except for '2-Ethylhexyl'. '2-Ethylhexyl' is represented by the term 'octyl' due to its widespread usage (*e.g.* Dioctyl sodium sulfosuccinate, Octyl myristate). Therefore esters or other derivatives of 2-Ethylhexylhexanoic acid are also named as Octanoic acid derivatives (*e.g.* Iso-decyl octanoate). Straight-chain eight-carbon groups are usually named with the appropriate stem derived from caprylic acid. (See also rules 16 and 17.)

16. The following table has been included to clarify the nomenclature for derivatives of caproic, caprylic and capric acids.

<i>Chain length</i>	<i>Stem name</i>	<i>Acid</i>	<i>Ester</i>
C6	Capro	Caproic	Caproate
C8	Capryl	Caprylic	Caprylate
C10	Capr	Capric	Caprate
<i>Chain length</i>	<i>Acyl</i>	<i>Alkyl</i>	<i>Ampho</i>
C6	Caprooyl	Caproyl	Caproo
C8	Capryloyl	Caprylyl	Caprylo
C10	Caproyl	Capryl	Capro

17. The following table describes the nomenclature applied to straight-chain acids and alcohols. Branched-chain acids and alcohols utilize the names listed in this table preceded by the term 'iso' (e.g. Isosteraric acid). Guerbet alcohols, however, are designated by specific names (e.g. Octyldodecanol). (See also rule 15.)

Saturated:

	<i>Acid</i>	<i>Alcohol</i>
C6	Caproic	Hexyl
C7	Heptanoic	Heptyl
C8	Caprylic	Caprylyl
C9	Pelargonic	Nonyl
C10	Capric	Decyl
C11	Undecanoic	Undecyl
C12	Lauric	Lauryl
C13	Tridecanoic	Tridecyl
C14	Myristic	Myristyl
C15	Pentadecanoic	Pentadecyl
C16	Palmitic	Cetyl
C17	Margaric	Heptadecyl
C18	Stearic	Stearyl
C20	Arachidic	Arachidyl
C22	Behenic	Behenyl

Unsaturated:

C11	Undecylenic	Undecylenyl
C16	Palmitoleic	Palmitoleyl
C18	Oleic	Oleyl
C18	Linoleic	Linoleyl
C18	Linolenic	Linolenyl
C20	Arachidonic	Arachidonyl
C22	Cetoleic	Cetoleyl
C22	Erucic	Erucyl

18. The nomenclature for ingredients consisting of mixtures of similar materials (e.g. fatty acids, fatty alcohols) is determined on the basis of the chemical identity of the raw material as purchased. Mixtures that reflect the original distribution of components due to their natural source (e.g. coconut) are named utilizing the source stem (e.g. coconut alcohol). If the original natural distribution has been significantly cut or enriched, the mixture is named on the basis of the predominant component.
19. Names of lanolin derivatives usually contain the stem 'lan'.
20. Alkanolamides are named by the specific alkyl amide stem and the appropriate abbreviation, e.g. 'MEA', 'DEA', owing to the widespread use of these denominations.
21. The dimethyl term is omitted and is assumed in all alkyl dimethyl amine oxide names (e.g. Stearamine oxide). Tertiary amine oxides with different substituent groups are named completely (e.g. Dihydroxyethyl stearamine oxide).

22. Quaternary ammonium salts usually have the suffix '-ium' in the stem of the cation. The term 'monium' describes a monomethyl-substituted quaternary nitrogen; 'dimonium' describes a dimethyl-substituted quaternary nitrogen; 'trimonium' describes a trimethyl-substituted quaternary nitrogen.
23. The terms quaternium/polyquaternium are used to describe complex quaternary ammonium salts that do not have a common name or that cannot be named by analogy to established names (e.g. Quaternium-82, Polyquaternium-20).
24. The term 'ampho' has been used as a combining term in the nomenclature for the imidazoline-type amphoteric surfactants. In naming these compounds, this stem is combined with the appropriate stem names for the substituent groupings (e.g. Sodium Cocoamphoacetate).
25. Common fatty stem terms are used to designate the alkyl portion of alkyl imidazoline compounds (e.g. Lauryl Hydroxyethyl Imidazoline) even though one carbon atom of the fatty radical becomes a member of the heterocyclic ring during the materials' manufacture.
26. Biological materials are named by specific terms (e.g. Hyaluronic Acid) when the material has been isolated, purified and chemically characterized. Alternate nomenclature for biologicals (e.g. Glycosamino-glycans or Spleen extract) is utilized to name materials in accordance with the extent of their processing.
27. Cosmetic colorants have INCI names according to the nomenclature used in Annex IV to Directive 76/768/EEC.
28. Hair dye ingredients are named according to chemical structure. In the event that chemical names are very complex, a colour/number combination is used prefixed by the letters 'HC'.
29. Denatured alcohols are designated by the INCI name 'Alcohol denat.'. Alcohol denat. is ethyl alcohol that is denatured with one or more denaturing agents in accordance with the national legislation of each Community Member State.
30. Materials derived from plants are known as botanicals. They have INCI names based on the international Linné designated nomenclature of the genus and the species. Chemical derivatives of botanicals follow the nomenclature rules for chemicals.
31. Name/number combinations are used as INCI names for cosmetic ingredients only where the complexity and/or similarity of ingredients precludes assignment of reasonable nomenclature by any other means. In all cases where arbitrary numbers are used, these numbers are preceded by names suggestive of the structure or the composition of the material. Each name/number combination represents a specific ingredient that is listed in the Inventory. The following name/number series of combinations have been used:
 - (a) *Benzophenone*
This term is used for all benzophenone derivatives (e.g. Benzophenone-2).
 - (b) *HC colour*
See rule 28.
 - (c) *Quaternium/Polyquarternium*
See rule 23.
 - (d) *Hydrofluorocarbon/Hydrochlorofluorocarbon*
These terms are used for hydrohalocarbon aerosol propellants (e.g. Hydrofluorocarbon 152a, Hydrochlorofluorocarbon 142b).
 - (e) *Polysilicone*
This term is used to describe complex silicone polymers that cannot be named by common names or established conventions for silicone compounds (e.g. Polysilicone-1).

32. Compounded mixtures created by combining several materials are named by listing each ingredient present in descending order of predominance.
33. The INCI names for extracts represent the 'material extracted' and do not include reference to the extracting solvents and/or other diluents that may be present in these materials.
34. Solvents and/or diluents contained in commercially available raw materials such as surfactants, polymers and resins are not normally identified as part of the INCI name.
35. Alkoxylated materials are named by including the alkoxylation level as the average number of moles of ethylene oxide and/or propylene oxide.

Ethoxylates, which are commonly expressed by an approximate molecular weight, are converted to the number of moles using the following table:

Approximate molecular weight	Average number of moles
100	2
200	4
300	6
400	8
450	9
500	10
600	12
1 000	20
1 540	32
1 800	36
2 000	40
3 000	60
4 000	75
6 000	150
8 000	180

Numerical designations included in alternate chemical names for ethoxylated compounds describe the average number of moles of ethoxylation when stated parenthetically, *e.g.* Polyethylene glycol (20 000).

Without parenthetical notation, the numerical value identifies molecular weight, *e.g.* Polyethylene glycol 20 000.

36. Ethoxylated alcohols are named by completing the conventional alcoholic stem name with 'eth' followed by the average number of moles of ethylene oxide.
37. The polyethylene glycol fraction of all other ethoxylated compounds that are not named by rule 6 or 36 is followed by the average number of moles of ethylene oxide.
38. The term 'Pareth' applies to ethoxylated paraffinic alcohols containing both even- and odd-carbon chain length fractions.
39. The term 'Acrylates' is used to describe linear, non-cross-linked copolymers that contain combinations of acrylic acid, methacrylic acid and their simple esters. Similarly, the term 'Crotonate(s)' is used to describe the copolymers that contain combinations of crotonic acid and its simple esters.
40. The name 'Carbomer' is used to describe high molecular weight cross-linked homopolymers of acrylic acid. The cross-linking agent(s) is (are) identified in the ingredient monograph definition. (See also rule 41.)
41. The term 'cross-polymer' is used to describe polymers other than Carbomer that are cross-linked. (See also rule 40.)
